

Task for Lecture 6

- Add "C" and "e" to your tables from last lecture by following the procedure below, using the table given in the slides from today.
 - While running the algorithm, calculate C for each iteration
 - Examine your results and determine, if possible, a reasonable C
 - Calculate the estimated error for each iteration, either with saved data, or by running the algorithm again
 - Finally evaluate the error and through this the efficiency of the method.

Bonus: Why might it not be possible to determine a C ?
